

# Quick start guide

## 1 Download the RapidAIM app

## 2 Register for an account

## 3 Scan trap barcode

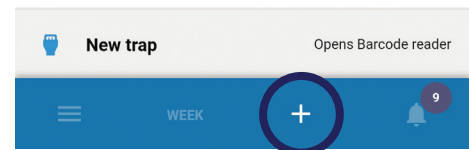

(see page 4 in the manual)

### Important:

Complete this step before traps are activated!

When your new trap arrive associate each one to your account with the app and the trap barcode

## 4 Prep traps for field deployment

(steps 1-3, pages 7-9 in the manual)

- » Attach antenna
- » Attach hanging rope
- » Attach lure

## 5 Activate and deploy traps

(pages 10-15 in the manual)

### Important:

Complete this step at the deployment site

- » Plug in the battery (red light will come on)
- » Hang trap in tree
- » Wait 5 minutes to check that the red light turns off

Traps will appear in the app within 30 minutes of deployment.

## Tips for optimizing trap deployment

To ensure a tight link with management, we recommend hanging at least one trap per 1-2 hectares. At this density, fruit fly hotspots will be immediately identified, which will provide you with confidence in the effectiveness of your control strategy. Placing traps at lower densities, e.g. 1 per 5 ha, provides information about fruit fly trends over time but won't provide the same precise early detection.

A spike in pests, and at many traps on Sunday

3 days later detections have fallen to zero
